Forward School

Program Code: J620-002-4:2020

Program Name: FRONT-END SOFTWARE DEVELOPMENT

Title: Exercise 2

Name: Chuay Xiang Ze

IC Number: 021224070255

Date: 22/06/2023

Introduction: Learning how to implement if else.

Conclusion: Managed to solve problems with codes learnt.

EXERCISE 2

RUN ME

Please run the code snippet below. It is required for running tests for your solution.

```
In [19]:
```

```
def test(got, expected):
    if got == expected:
        prefix = ' OK '
    else:
        prefix = ' FAIL '
    print(('%s got: %s expected: %s' % (prefix, repr(got), repr(expected))))
```

```
In [20]:
```

```
# D. verbing
# Given a string, if its length is at least 3,
# add 'ing' to its end.
# Unless it already ends in 'ing', in which case
# add 'ly' instead.
# If the string length is less than 3, leave it unchanged.
# Return the resulting string.
def verbing(s):
  #++ your code here ++
   if len(s) >= 3:
        if s[-3:] == 'ing':
            s = s + 'ly'
        else:
            s = s + 'ing'
    return s
print('verbing')
test(verbing('hail'), 'hailing')
test(verbing('swiming'), 'swimingly')
test(verbing('do'), 'do')
verbing
```

OK got: 'hailing' expected: 'hailing'
OK got: 'swimingly' expected: 'swimingly'
OK got: 'do' expected: 'do'

In [116]:

```
# E. not bad
# Given a string, find the first appearance of the
# substring 'not' and 'bad'. If the 'bad' follows
# the 'not', replace the whole 'not'...'bad' substring
# with 'good'.
# Return the resulting string.
# So 'This dinner is not that bad!' yields:
# This dinner is good!
def not_bad(s):
    #++ your code here ++
    find_not = s.find("not")
    find_bad = s.find("bad")
    if find_bad > find_not:
        new_string = s.replace(s[find_not: find_bad + 3], "good")
    elif find_bad == -1 or find_bad < find_not:</pre>
        new_string = s
    return new_string
print()
print('not_bad')
test(not_bad('This movie is not so bad'), 'This movie is good')
test(not_bad('This dinner is not that bad!'), 'This dinner is good!')
test(not_bad('This tea is not hot'), 'This tea is not hot')
test(not_bad("It's bad yet not"), "It's bad yet not")
```

```
not_bad
OK got: 'This movie is good' expected: 'This movie is good'
OK got: 'This dinner is good!' expected: 'This dinner is good!'
OK got: 'This tea is not hot' expected: 'This tea is not hot'
OK got: "It's bad yet not" expected: "It's bad yet not"
```

In [118]:

```
import math
# F. front_back
# Consider dividing a string into two halves.
# If the length is even, the front and back halves are the same length.
# If the length is odd, we'll say that the extra char goes in the front half.
# e.g. 'abcde', the front half is 'abc', the back half 'de'.
# Given 2 strings, a and b, return a string of the form
# a-front + b-front + a-back + b-back
def front_back(a, b):
    lengthA = math.ceil(len(a) / 2)
    lengthB = math.ceil(len(b) / 2)
    first_halfA = a[:lengthA]
    first_halfB = b[:lengthB]
    last_halfA = a[lengthA:]
    last_halfB = b[lengthB:]
    return first_halfA + first_halfB + last_halfA + last_halfB
print()
print('front_back')
test(front_back('abcd', 'xy'), 'abxcdy')
test(front_back('abcde', 'xyz'), 'abcxydez')
test(front_back('Kitten', 'Donut'), 'KitDontenut')
```

Question 4

OK got: 'abxcdy' expected: 'abxcdy'
OK got: 'abcxydez' expected: 'abcxydez'

OK got: 'KitDontenut' expected: 'KitDontenut'

front_back

In [39]:

```
# Define a procedure weekend which takes a string as its input, and
# returns the boolean True if it's 'Saturday' or 'Sunday' and False otherwise.
def weekend(day):
    if day == ("Saturday" or 'Sunday'):
        return True
    else:
        return False

print(weekend('Monday'))
#>>> False

print(weekend('Saturday'))
#>>> True

print(weekend('July'))
#>>> False
```

False True False

```
In [72]:
```

```
# By Ashwath from Udacity forums
# A leap year baby is a baby born on Feb 29, which occurs only on a leap year.
# Define a procedure is_leap_baby that takes 3 inputs: day, month and year
# and returns True if the date is a leap day (Feb 29 in a valid leap year)
# and False otherwise.
# A year that is a multiple of 4 is a leap year unless the year is
# divisible by 100 but not a multiple of 400 (so, 1900 is not a leap
# year but 2000 and 2004 are).
